Hurricane Season **Alert** Follow These Tips To Ensure The Quality Of Your Lens

Moisture Inside The Lens

- ENG Lenses are not air tight or sealed. It is very important to the operation that the lens breaths.
- If the lens becomes damp because of fog, mist, drizzle or putting in a damp case, wipe off moisture with a soft dry cloth and seal the lens together with an efficient desiccant pack in a plastic zip lock bag to remove moisture which has entered in the interior.
- Do not bring the lens, when kept in a very cold ambient temperature, into a warm room, because the lens may fog on the inside or it may cause a condensation problem. The lens cannot be used until the problem is cleared.
- If it is necessary to use the lens under such conditions, it is recommended to take a countermeasure. Before bringing a lens into a warm room, put the lens in a vinyl bag that is effectively dry and then bring it to the shooting location prior to the shoot. After the temperature of the lens has become the same level of the shoot location, take the lens out of the bag.
- For other major issues, let TeleOptics give your lens the proper maintenance it needs to make your next broadcast production a success!
